Flying chess | candidate repeated bridge channel | DRAFT

A: gate drive, FETs, bootstrap and local bypass

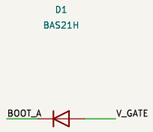

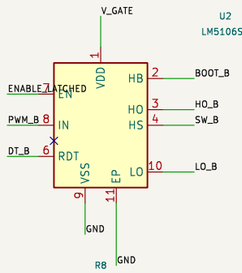

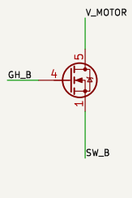

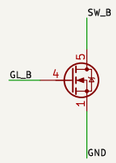

B: second bridge leg; PWM_A/PWM_B require synchronized center-aligned unipolar modulation

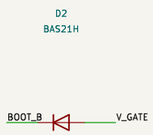

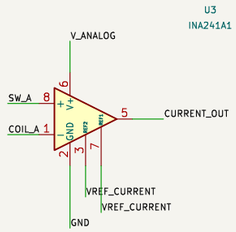

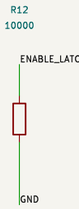

Current path: SW_A -> R11 -> COIL_A -> winding -> SW_B. Kelvin-route R11 sense connections.

External contracts below are NOT completed supply circuits. ENABLE_LATCHED requires independent hardware overcurrent shutdown.

ADC, reference buffering, supply regeneration, shared bulk, watchdog and connector/termination design remain open.

Sense transfer: 2.5 V + I x 0.02 ohm x 10; V_ANALOG = 5 V.
